#### Glossary

allele A gene variant with a specific sequence and

phenotype.

E-cadherin Epithelial cadherin (calcium-dependent ad-

hesion), a cell-adhesion protein encoded by

CDH1.

gene expression A measure of the relative expression of each

gene from the mRNA extracted from (pooled)

cells.

graph or network A mathematical structure modelling or depict-

ing the relationships between elements.

hereditary A trait or disease which has a genetic cause

and is inherited from family members.

intrinsic subtype Distinguishing cancer by molecular and ge-

netic features.

metagene A consistent signal of expression for a collec-

tion of genes such as a biological pathway, de-

rived from singular value decomposition.

microarray A high-throughput technique to measure pres-

ence or abundance of nucleic acid sequences

from binding to probes.

mutation A change in DNA sequence that disrupts gene

function.

pathway A series of biomolecules that produces a par-

ticular product or biological function.

recurrent mutation The repeated occurrence of mutations in a

particular gene across cancers.

RNA-Seq The generation of transcriptome data from se-

quencing RNA.

somatic mutation A mutation that occurs in somatic cells, dur-

ing a patient's lifespan.

synthetic lethal Genetic interactions where inactivation of

multiple genes is inviable (or deleterious) which are viable if inactivated separately.

tumour suppressor A gene potentially causes cancer, typically by

disruption of functions which protect the cell

from cancer.

wild-type A natural phenotype of a trait or the normally

functional allele which encodes it.

## Acronyms

# Mutation Analysis in Breast Cancer

### C.1 Synthetic Lethal Genes and Pathways

SLIPT expression analysis (described in Section 3.1) on The Cancer Genome Atlas (TCGA) breast cancer data (n = 969) found the following genes and pathways, described in Sections 4.1 and 4.1.1.

Table C.1: Candidate synthetic lethal gene partners of CDH1 from mtSLIPT

Gene	$\mathbf{Observed}^*$	$\mathbf{Expected}^*$	$\chi^2$ value	p-value	p-value (False discovery rate (FDR))
TFAP2B	8	36.7	89.5	$3.60 \times 10^{-20}$	$8.37 \times 10^{-17}$

Translation	141	64	$3.7 \times 10^{-101}$
Influenza Life Cycle	112	57	$1.4 \times 10^{-100}$
GPCR downstream signalling	472	116	$1.0\times10^{-80}$
Hemostasis	422	105	$1.4\times10^{-78}$

Gene set over-representation analysis (hypergeometric test) for Reactome pathways in mtSLIPT partners for CDH1.

The genes and pathways identified in Tables C.1 and C.2 were derived from comparing the expression profiles of potential partners to the mutation status of *CDH1* (as shown in Figure 3.2). The following analysis was limited to the samples for which both expression and somatic mutation data were available from TCGA.

### C.2 Synthetic Lethal Expression Profiles

Similar to the analysis of synthetic lethal partners against low *CDH1* expression in 4.1.2, the partners detected from *CDH1* mutation were also examined for their expression profiles and the pathway composition of gene clusters. Hierachical clustering was performed on mtSLIPT partners for *CDH1* as showing in Figure C.1. Overrepresentation for Reactome pathways for each of the gene clusters identified is given in Table C.3.

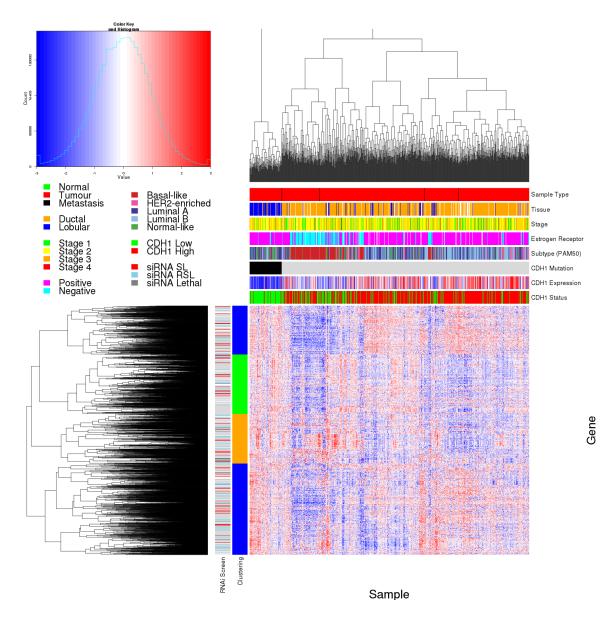

Figure C.1: Synthetic lethal expression profiles of analysed samples. Gene expression profile heatmap (correlation distance) of all samples (separated by CDH1 somatic mutation status) analysed in TCGA breast cancer dataset for gene expression of 3743 candidate partners of E-cadherin (CDH1) from mtSLIPT prediction (with significant FDR adjusted p < 0.05). Deeply clustered, inter-correlated genes form several main groups, each containing genes that were SL candidates or toxic in an siRNA screen Telford  $et\ al.\ (2015)$ . Clusters had different sample groups highly expressing the synthetic lethal candidates in CDH1 mutant samples and often lowly expressing CDH1 wild-type samples (which were not tested for), although many of the CDH1 mutant samples had among the lowest CDH1 expression. In contrast to the expression analysis the (predominantly CDH1wild-type) basal subtype and ER negative samples have depleted expression among most candidate synthetic lethal partners.

Table C.3: Pathways for clusters of  $\mathit{CDH1}$  partners from mtSLIPT

Pathways Over-represented in Cluster 1	Pathway Size	Cluster Genes	p-value (FDR)
Olfactory Signalling Pathway	57	8	$7.1 \times 10^{-9}$
Assembly of the primary cilium	149	14	$8.0\times10^{-9}$

Pathway over-representation analysis for Reactome pathways with the number of genes in each pathway (Pathway Size), number of genes within the pathway identified (Cluster Genes), and the pathway over-representation p-value (adjusted by FDR) from the hypergeometric test.

#### C.3 Comparison to Primary Screen

The mutation synthetic lethal partners with *CDH1* were also compared to siRNA primary screen data (Telford *et al.*, 2015), as performed in Section 4.2.1. These were expected to be more concordant with the experimental results performed on a null mutant, however this was not the case at the gene level: less genes overlapped with experimental candidates in Figure C.2. This discrepancy was may be due to lower sample size for mutations in TCGA data or lower frequency (expected value) of *CDH1* mutations compared to low expression.

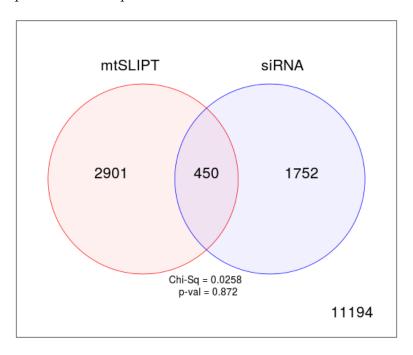

Figure C.2: Comparison of mtSLIPT to siRNA. Testing the overlap of gene candidates for E-cadherin synthetic lethal partners between computational (SLIPT) and experimental screening (siRNA) approaches. The  $\chi^2$  test suggests that the overlap is no more than would be expected by chance (p = 0.281).

Despite a lower sample size (and low number of a predicted partners) for mutation analysis, the pathway composition (Tables C.2 and C.4) was similar to expression analysis, as described in Section 4.2.5. In particular, the resampling analysis (Section C.3.1) supported many of the results of expression analysis (Section 4.2.5.1). Tables C.5 and C.6 detected many of the same or functionally-related pathways.

Table C.4: Pathways for  $\mathit{CDH1}$  partners from mtSLIPT and siRNA

Predicted only by SLIPT (2901 genes)	Pathway Size	Genes Identified	- ' '
Eukaryotic Translation Elongation	87	57	$2.8 \times 10^{-120}$
Peptide chain elongation	84	56	$3.1 \times 10^{-120}$
Eukaryotic Translation Termination	84	55	$2.8 \times 10^{-117}$
Viral mRNA Translation	82	54	$4.1 \times 10^{-116}$

### C.4 Compare SLIPT genes

The mutation synthetic lethal partners with *CDH1* were also compared to siRNA primary screen data (Telford *et al.*, 2015), by correlation and siRNA viability as described in Sections 4.2.2 and 4.2.3.

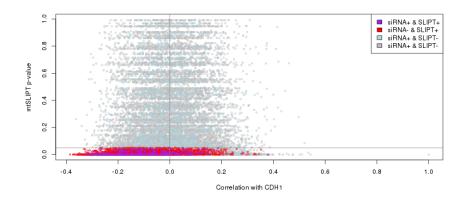

Figure C.3: Compare mtSLIPT and siRNA genes with correlation. The mtSLIPT p-values were compared against Pearson correlation of expression with *CDH1*. Genes detected by SLIPT or siRNA were coloured according to the legend.

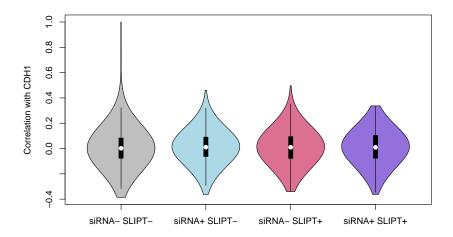

Figure C.4: Compare mtSLIPT and siRNA genes with correlation. Genes detected by mtSLIPT against *CDH1* mutation and siRNA screening were compared against Pearson correlation of expression with *CDH1*. There were no differences in correlation between the gene groups.

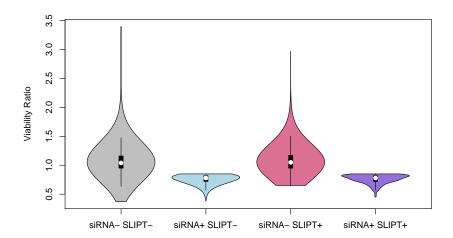

Figure C.5: Compare mtSLIPT and siRNA genes with siRNA viability. Genes detected as candidate synthetic lethal partners by mtSLIPT (in TCGA breast cancer) expression analysis against *CDH1* mutation and experimental screening (with siRNA) were compared against the viability ratio of *CDH1* mutant andwild-type cells in the primary siRNA screen. There were clear no differences in viability between genes detected by mtSLIPT and those not with the differences being primarily due to viability thresholds that were used to detect synthetic lethality by Telford *et al.* (2015).

## Appendix D

## Metagene Analysis

Well characterised gene signatures from previous publications in breast cancer (Gatza et al., 2011, 2014) were used to demonstrate to utility of the metagene approach for use on a wider range of pathways as was performed with the Reactome (Croft et al., 2014) pathways as an alternative approach to identification of synthetic lethal pathways. The direction of metagenes is arbitrary but they have been corrected to ensure the metagene increases in a direction which reflects overall activation of the pathways (as described in Section 2.2.3) which was verified by examining in the pathway signatures in breast cancer. Metagenes were derived for these pathways signatures (Gatza et al., 2011, 2014), which were expected to have particular molecular properties in clinical and molecular subtypes (Parker et al., 2009; Perou et al., 2000). This was performed by examining the pathways expression of breast cancer gene signatures in TCGA expression data.

These gene signatures were used to establish that metagenes generated with this procedure reflect gene activity. The same metagene procedure (in Section 2.2.3) was applied to the Reactome pathways (Croft *et al.*, 2014). These Reactome metagenes were used for synthetic lethal analysis of pathways with SLIPT, directly using pathways activity for identifying synthetic lethal pathways with *CDH1*.

#### D.1 Pathway Signature Expression

Pathway metagenes (generated as described in Section 2.2.3) for gene signatures of key processes in breast cancer (Gatza et al., 2011) were used to check that metagenes were generated in the correct direction to indicate pathways activation. Some of these gene signatures are plotted in Figure D.1 for comparison with clinical factors and somatic mutations. The "intrinsic subtypes" was computed by performing the Prediction Analysis of Microarray 50 (PAM50) procedure Parker et al. (2009) for RNA-Seq data

which was highly concordant ( $\chi^2 = 1305.9$ ,  $p = 2.73 \times 10^{-268}$ ) with the subtypes provided by University of California, Santa Cruz (UCSC) (UCSC, 2012) for TCGA samples (Koboldt *et al.*, 2012) previously analysed by microarrays (as shown in Appendix E). Somatic mutations were reported for glslinkrecurrent mutationrecurrently mutated genes in breast cancer, as reported by TCGA (Koboldt *et al.*, 2012), related genes, and those previously discussed to be important in hereditary breast cancers (*BRCA1*, *BRCA2*, and *CDH1*).

These gene signatures reflect intrinsic subtypes as expected. In particular, the estrogen and progesterone receptor signatures are low in the predominantly Estrogen receptor  $(ER)^-$  and Progesterone receptor  $(PR)^-$  basal-like subtype tumours. These tumours also had the highest frequency of TP53 mutations and a corresponding reduction of p53 metagene activity, as expected for loss of a tumour suppressor. The luminal A and luminal B tumour subtypes are the most similar, which is reflected in these metagenes signatures, although they are distinguishable molecular subtypes as shown by elevated phosphoinositide 3-kinase (PI3K), AKT, RAS, and  $\beta$ -catenin signalling in luminal B tumours. However, these pathways were also elevated in basal-like and HER2-enriched subtypes and lowly expressed in the "normal-like" subtype (which contained the normal samples).

The direction of each metagene was consistent with the clinical characteristics, which formed a consensus of gene activity as shown for the PI3K and ER signatures (Gatza et al., 2011) in Figure D.2. The expression of the majority of the genes were highly concordant with the metagene, being either positively or negatively correlated. These were generally consistent with established clinical and molecular subtypes of breast cancer and the recurrent mutations shown.

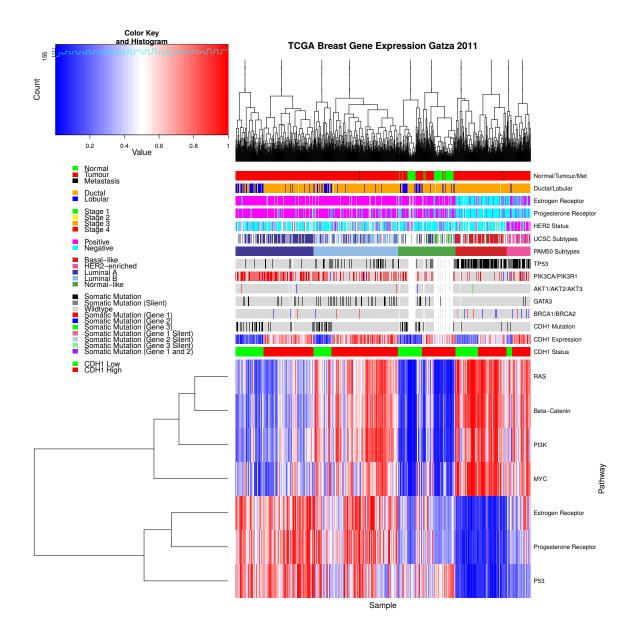

Figure D.1: Pathway metagene expression profiles. Expression profiles for metagene signatures from Gatza et al. (2011) in TCGA breast data, annotated for clinical factors (with sample types and histological results coloured according to the legend) and cancer gene mutations (Negative values for mutation are light grey with missing data in white). Intrinsic subtypes are shown as derived from microarray (UCSC) and RNA-Seq (PAM50) data (Koboldt et al., 2012; Parker et al., 2009). Samples were clustered independently for each intrinsic subtypes and by CDH1 expression status. Pathway expression signatures are consistent with mutations and clinical subgroups.

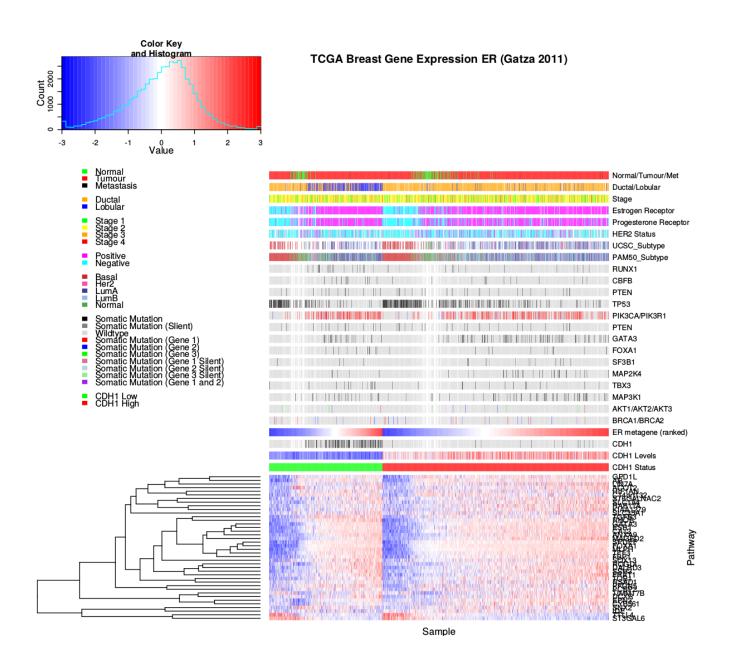

Figure D.2: Expression profiles for estrogen receptor related genes. Expression profiles the genes contained in the estrogen receptor (ER) gene signature from Gatza et al. (2011) in TCGA breast data, annotated for clinical factors and cancer gene mutations. Samples are separated by CDH1 expression status and sorted by the metagene. In both cases, the majority of genes were consistent with the direction of the metagene, with very few exceptions being inversely correlated. Estrogen receptor (by antibody staining) negative samples had low metagene expression, as expected. These were more likely to be ductal and basal subtypes, lacking CDH1 or PIK3CA mutations.

### D.2 Synthetic Lethal Reactome Metagenes

Metagene analysis was performed for synthetic lethal pathways against CDH1 mutation. These were described and compared to expression analysis in Section 4.3.

Table D.1: Candidate synthetic lethal metagenes against CDH1 from mtSLIPT

Pathway	ID	Observed	Expected	$\chi^2$ value	p-value	p-value (FDR)
Neurotoxicity of clostridium toxins	168799	8	36.7	79.4	$5.71\times10^{-18}$	$3.14 \times 10^{-15}$

Strongest candidate synthetic lethal partners for CDH1 by mtSLIPT with observed and expected numbers of mutant CDH1 TCGA breast cancer tumours with low expression of partner metagenes.

## Appendix E

# Intrinsic Subtyping

The intrinsic subtypes for TCGA breast cancer samples provided by UCSC (Koboldt et al., 2012; UCSC, 2012) that were derived from microarray analysis have been compared to the PAM50 results for performing subtyping from RNA-Seq data (Parker et al., 2009). As shown in Table E.1, these subtypes were highly concordant for samples which had both procedures performed upon them ( $\chi^2 = 1305.9$ ,  $p = 2.73 \times 10^{-268}$ ). The main exception were the luminal A samples some of which were reclassified as luminal B or "normal-like".

Table E.1: Comparison of intrinsic subtypes

	UC	CSC Subtyp	e	
Basal-like	HER2-enriched	Luminal A	Luminal B	Normal-like
100	58	232	128	30
	PA	M50 Subtyp	e	
Basal-like	PAI HER2-enriched	<i>-</i>		Normal-like
Basal-like 208		<i>-</i>		Normal-like 227

	UCSC Subtype					
PAM50 Subtype	Basal-like	HER2-enriched	Luminal A	Luminal B	Normal-like	
Basal-like	96	4	2	2	1	
HER2-enriched	0	47	5	3	0	
Luminal A	1	0	141	1	0	
Luminal B	2	7	49	121	0	
Normal-like	1	0	35	1	29	

The intrinsic subtypes of TCGA breast samples were compared between those provided by UCSC (Koboldt  $et\ al.$ , 2012) from microarray expression to those derived from RNA-Seq data (Parker  $et\ al.$ , 2009). Comparisons between these were limited to samples for which both data types were available.

The PAM50 subtypes could be more accurate given similarity of these subtypes and that the remainder of the subtypes were accurately recapitulated with RNA-Seq data. Furthermore, UCSC subtypes correctly identified <sup>22</sup>/<sub>22</sub> normal samples as "normal-like" and PAM50 subtyping in RNA-Seq data had a success rate of <sup>112</sup>/<sub>113</sub> (including all of those identified from microarrays). Therefore the PAM50 subtypes (performed on a larger cohort of samples) are appropriate to use for further interpretation, superseding the UCSC subtypes available for a limited set of samples.

# Appendix F

## Stomach Expression Analysis

The following results are a replication of the TCGA results (in Chapter 4) with stomach cancer data, using synthetic lethality (SLIPT) against *CDH1*.

### F.1 Synthetic Lethal Genes and Pathways

Table F.1: Synthetic lethal gene partners of CDH1 from SLIPT in stomach cancer

Gene	$\mathbf{Observed}^*$	$\mathbf{Expected}^*$	$\chi^2$ value	p-value	p-value (FDR)
PRAF2	17	50.4	121	$3.54\times10^{-25}$	$1.45\times10^{-21}$

Cap-dependent Translation Initiation	112	52	$2.0 \times 10^{-90}$

Gene set over-representation analysis (hypergeometric test) for Reactome pathways in SLIPT partners for CDH1.

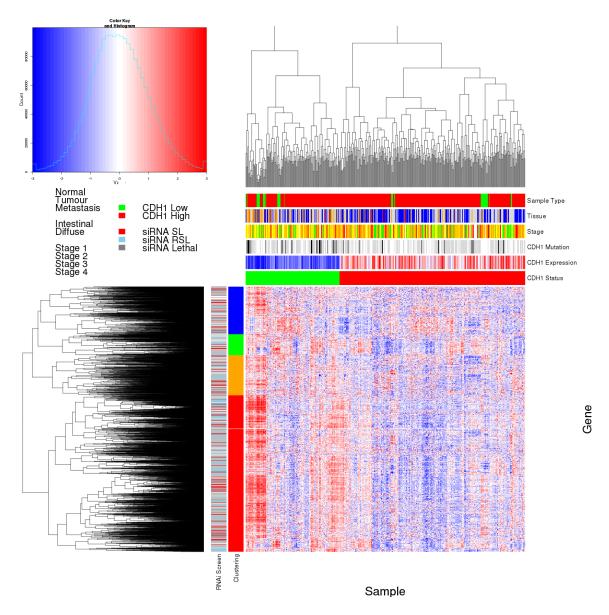

Figure F.1: Synthetic lethal expression profiles of analysed samples. Gene expression profile heatmap (correlation distance) of all samples (separated by the  $^{1}/_{3}$  quantile of CDH1 expression) analysed in TCGA stomach cancer dataset for gene expression of 4365 candidate partners of E-cadherin (CDH1) from SLIPT prediction (with significant FDR adjusted p < 0.05). Deeply clustered, inter-correlated genes form several main groups, each containing genes that were SL candidates or toxic in an siRNA screen Telford  $et\ al.\ (2015)$ . Clusters had different sample groups highly expressing the synthetic lethal candidates in CDH1 low samples. Notably, diffuse and CDH1 mutant samples had elevated expression in one or more distinct clusters, although there was less complexity and variation among candidate synthetic lethal partners than in breast data. CDH1 low samples also contained most of samples with CDH1 mutations.

Table F.3: Pathways for clusters of  $\mathit{CDH1}$  partners in stomach SLIPT

Pathways Over-represented in Cluster 1		Cluster Genes	- \
Viral mRNA Translation	82	48	$1.3 \times 10^{-97}$

Pathway over-representation analysis for Reactome pathways with the number of genes in each pathway (Pathway Size), number of genes within the pathway identified (Cluster Genes), and the pathway over-representation p-value (adjusted by FDR) from the hypergeometric test.

#### F.2 Comparison to Primary Screen

The synthetic lethal partners with *CDH1* expression in stomach cancers were also compared to siRNA primary screen data (Telford *et al.*, 2015), as performed in Section 4.2.1. These were expected to be more concordant with the experimental results performed on a null mutant, however this was not the case at the gene level: less genes overlapped with experimental candidates in Figure F.2. This may be due to lower sample size for mutations in TCGA data or lower frequency (expected value) of *CDH1* mutations compared to low expression.

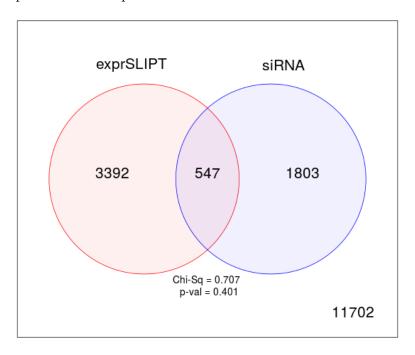

Figure F.2: Comparison of SLIPT in stomach to siRNA. The overlap of gene candidates for E-cadherin synthetic lethal partners between computational (SLIPT) and experimental screening (siRNA) approaches. The  $\chi^2$  test suggests that the overlap is no more than would be expected by chance (p = 0.281).

Table F.4: Pathways for  $\mathit{CDH1}$  partners from SLIPT and siRNA

Predicted only by SLIPT (3392 genes)	<u> </u>	Genes Identified	- , ,
Extracellular matrix organization	238	90	$3.4 \times 10^{-107}$
Eukaryotic Translation Termination	79	46	$7.6 \times 10^{-91}$

### F.2.1 Resampling Analysis

Table F.5: Pathways for CDH1 partners from SLIPT in stomach cancer

Reactome Pathway	Over-representation	Permutation
Extracellular matrix organization	$7.5 \times 10^{-140}$	0.070215
Hemostasis	$1.8 \times 10^{-121}$	0.25804
Developmental Biology	$9.2 \times 10^{-107}$	0.53032
Axon guidance	$1.5 \times 10^{-102}$	0.6704
Eukaryotic Translation Termination	$1.9 \times 10^{-99}$	$> 1.031 \times 10^{-5}$
GPCR ligand binding	$3.8 \times 10^{-99}$	0.54914
Viral mRNA Translation	$3.3 \times 10^{-98}$	$> 1.031 \times 10^{-5}$
Formation of a pool of free 40S subunits	$3.3 \times 10^{-98}$	$> 1.031 \times 10^{-5}$
Eukaryotic Translation Elongation	$1.6 \times 10^{-97}$	$> 1.031 \times 10^{-5}$
Peptide chain elongation	$7.2 \times 10^{-97}$	$> 1.031 \times 10^{-5}$
Class A/1 (Rhodopsin-like receptors)	$2.7 \times 10^{-96}$	0.58174
Nonsense Mediated Decay independent of the Exon Junction Complex	$3 \times 10^{-96}$	$> 1.031 \times 10^{-5}$
Infectious disease	$2.6 \times 10^{-94}$	0.25484
GTP hydrolysis and joining of the 60S ribosomal subunit	$3.4 \times 10^{-94}$	$> 1.031 \times 10^{-5}$
L13a-mediated translational silencing of Ceruloplasmin expression	$2.8 \times 10^{-92}$	$> 1.031 \times 10^{-5}$
3' -UTR-mediated translational regulation	$2.8 \times 10^{-92}$	$> 1.031 \times 10^{-5}$
Neuronal System	$8.4 \times 10^{-92}$	0.53433
SRP-dependent cotranslational protein targeting to membrane	$9.5 \times 10^{-92}$	$> 1.031 \times 10^{-5}$
Eukaryotic Translation Initiation	$2.0 \times 10^{-90}$	$> 1.031 \times 10^{-5}$
Cap-dependent Translation Initiation	$2.0 \times 10^{-90}$	$> 1.031 \times 10^{-5}$
Nonsense-Mediated Decay	$7.4 \times 10^{-90}$	$> 1.031 \times 10^{-5}$
Nonsense Mediated Decay enhanced by the Exon Junction Complex	$7.4 \times 10^{-90}$	$> 1.031 \times 10^{-5}$
Adaptive Immune System	$8.1 \times 10^{-88}$	0.14116
Translation	$1.3 \times 10^{-87}$	$> 1.031 \times 10^{-5}$
Platelet activation, signalling and aggregation	$1.3 \times 10^{-86}$	0.28959
Influenza Infection	$1 \times 10^{-82}$	$> 1.031 \times 10^{-5}$
Influenza Viral RNA Transcription and Replication	$2.4 \times 10^{-82}$	$> 1.031 \times 10^{-5}$
Influenza Life Cycle	$2 \times 10^{-80}$	$> 1.031 \times 10^{-5}$
Response to elevated platelet cytosolic Ca2 <sup>+</sup>	$4.9 \times 10^{-78}$	0.50817
Signalling by NGF	$1.6 \times 10^{-75}$	0.38518
Rho GTPase cycle	$5.1 \times 10^{-75}$	0.14864
Signalling by PDGF	$7.4 \times 10^{-74}$	0.40493
Signalling by Rho GTPases	$5.1 \times 10^{-73}$	0.077217
Glycosaminoglycan metabolism	$1.4 \times 10^{-68}$	0.52984
$G_{\alpha i}$ signalling events	$1.8 \times 10^{-66}$	0.9254
Metabolism of carbohydrates	$1.1 \times 10^{-65}$	0.39501
$G_{as}$ signalling events	$2.7 \times 10^{-65}$	0.0050293
Potassium Channels	$2.7 \times 10^{-65}$	0.53359
Transmission across Chemical Synapses	$1.8 \times 10^{-64}$	0.81833
ECM proteoglycans	$3.4 \times 10^{-64}$	0.083482
Peptide ligand-binding receptors	$4.8 \times 10^{-64}$	0.003402
Degradation of the extracellular matrix	$4.8 \times 10^{-63}$ $1.1 \times 10^{-63}$	0.80879
Platelet homeostasis	$5.3 \times 10^{-63}$	0.53134
NGF signalling via TRKA from the plasma membrane	$6.1 \times 10^{-63}$	0.55154
Integration of energy metabolism	$4.5 \times 10^{-61}$	
· · · · · · · · · · · · · · · · · · ·	$4.5 \times 10^{-61}$ $5.4 \times 10^{-61}$	0.10889
Collagen formation  Integrin cell surface interactions		0.29896
Integrin cell surface interactions  Collegen biggraphics and modifying anythrough	$7 \times 10^{-59}$	0.18167
Collagen biosynthesis and modifying enzymes  Neurotransmitter Receptor Binding And Downstream Transmission	$7 \times 10^{-59}$	0.30208
Neurogransmiller Receptor Binding And Downstream Transmission	$8.7 \times 10^{-57}$	0.00500
In The Postsynaptic Cell	$8.7 \times 10^{-57}$ $8.7 \times 10^{-57}$	0.82522

Over-representation (hypergeometric test) and Permutation p-values adjusted for multiple tests across pathways (FDR). Significant pathways were marked in bold (FDR < 0.05) and italics (FDR < 0.1).

Table F.6: Pathways for CDH1 partners from SLIPT in stomach and siRNA

Reactome Pathway	Over-representation	Permutation
Platelet activation, signalling and aggregation	$3.9 \times 10^{-9}$	0.49557
Class A/1 (Rhodopsin-like receptors)	$3.9\times10^{-9}$	0.98432
Response to elevated platelet cytosolic Ca2 <sup>+</sup>	$5.5\times10^{-8}$	0.54349
Platelet homeostasis	$5.7 \times 10^{-8}$	0.45017
Nucleotide-like (purinergic) receptors	$1.8 \times 10^{-7}$	0.36966
Peptide ligand-binding receptors	$3.8 \times 10^{-7}$	0.91294
Molecules associated with elastic fibres	$7.1 \times 10^{-7}$	0.0025868
Amine ligand-binding receptors	$8.6\times10^{-7}$	0.43303
$G_{\alpha i}$ signalling events	$9.8 \times 10^{-7}$	0.99626
GPCR ligand binding	$1.1 \times 10^{-6}$	0.97733
Elastic fibre formation	$1.5\times 10^{-6}$	0.0025868
$G_{\alpha q}$ signalling events	$1.9 \times 10^{-6}$	0.86089
P2Y receptors	$3.8 \times 10^{-6}$	0.18795
Serotonin receptors	$3.8 \times 10^{-6}$	0.37853
Signal amplification	$2.3\times10^{-5}$	0.47856
Gastrin-CREB signalling pathway via PKC and MAPK	$2.3 \times 10^{-5}$	0.98567

ADP signalling through P2Y purinoceptor 12	392170	23	50.4	79.2	$2.57\times10^{-16}$	$7.71 \times 10^{-15}$
regulation of FZD by ubiquitination	4641263	22	50.4	78.8	$3.15\times10^{-16}$	$9.3\times10^{-15}$
Toxicity of tetanus toxin (TeNT)	5250982	27	50.4	78.7	$3.36\times10^{-16}$	$9.75 \times 10^{-15}$
Gap junction degradation	190873	21	50.4	78.5	$3.66\times10^{-16}$	$1.04\times10^{-14}$
Nephrin interactions	373753	25	50.4	78.2	$4.21\times10^{-16}$	$1.14\times10^{-14}$
GABA synthesis, release, reuptake and degradation	888590	26	50.4	77	$7.69\times10^{-16}$	$1.95 \times 10^{-14}$

Strongest candidate synthetic lethal partners for CDH1 by SLIPT with observed and expected numbers of TCGA stomach cancer samples with low expression of both genes.
