#### Glossary

E-cadherin Epithelial cadherin (calcium-dependent ad-

hesion), a cell-adhesion protein encoded by

CDH1.

gene expression A measure of the relative expression of each

gene from the mRNA extracted from (pooled)

cells.

graph or network A mathematical structure modelling or depict-

ing the relationships between elements.

metagene A consistent signal of expression for a collec-

tion of genes such as a biological pathway, derived from singular value decomposition.

mutation A change in DNA sequence that disrupts gene

function.

RNA-Seq Transcriptome data from sequencing RNA.

synthetic lethal Genetic interactions where inactivation of

multiple genes is inviable (or deleterious) which are viable if inactivated separately.

### Acronyms

ANOVA Analysis of Variance.

ER Estrogen Receptor.

FDR False Discovery Rate.

mRNA Messenger RNA.

mtSLIPT Synthetic Lethal Interaction Prediction Tool

(against mutation).

PAM50 Prediction Analysis of Microarray 50.

RNA Ribonucleic Acid.

siRNA Short Interfering RNA.

SLIPT Synthetic Lethal Interaction Prediction Tool.

TCGA The Cancer Genome Atlas (genomics project).

UCSC University of California, Santa Cruz.

## Mutation Analysis in Breast Cancer

## C.1 Synthetic Lethal Genes and Pathways

SLIPT expression analysis (described in Section 3.1) on TCGA breast cancer data (n = 969) found the following genes and pathways, described in sections 4.1 and 4.1.1.

Table C.1: Candidate synthetic lethal gene partners of CDH1 from mtSLIPT

Gene	Observed	Expected	$\chi^2$ value	p-value	p-value (False discovery rate (FDR))
TFAP2B	8	36.7	89.5	$3.60 \times 10^{-20}$	$8.37 \times 10^{-17}$
ZNF423	15	36.7	78.8	$7.89\times10^{-18}$	$1.22 \times 10^{-14}$
CALCOCO1	11	36.7	76.8	$2.09\times10^{-17}$	$2.59 \times 10^{-14}$
RBM5	13	36.7	75.7	$3.65\times10^{-17}$	$4.00 \times 10^{-14}$
BTG2	7	36.7	71.7	$2.72\times10^{-16}$	$1.81 \times 10^{-13}$
RXRA	6	36.7	70.5	$5.00\times10^{-16}$	$2.97 \times 10^{-13}$
SLC27A1	11	36.7	70.3	$5.42\times10^{-16}$	$2.97 \times 10^{-13}$
MEF2D	12	36.7	69.6	$7.86\times10^{-16}$	$3.95 \times 10^{-13}$
NISCH	12	36.7	69.6	$7.86\times10^{-16}$	$3.95 \times 10^{-13}$
AVPR2	9	36.7	69.2	$9.36\times10^{-16}$	$4.58 \times 10^{-13}$
CRY2	13	36.7	68.9	$1.07\times10^{-15}$	$4.98 \times 10^{-13}$
RAPGEF3	13	36.7	68.9	$1.07\times10^{-15}$	$4.98 \times 10^{-13}$
NRIP2	10	36.7	68.2	$1.58\times10^{-15}$	$7.18 \times 10^{-13}$
DARC	12	36.7	66.4	$3.76\times10^{-15}$	$1.54 \times 10^{-12}$
SFRS5	12	36.7	66.4	$3.76\times10^{-15}$	$1.54 \times 10^{-12}$
NOSTRIN	5	36.7	65.1	$7.40\times10^{-15}$	$2.70 \times 10^{-12}$
KIF13B	12	36.7	63.4	$1.69\times10^{-14}$	$5.16 \times 10^{-12}$
TENC1	10	36.7	62.5	$2.67\times10^{-14}$	$7.40 \times 10^{-12}$
MFAP4	12	36.7	60.5	$7.17\times10^{-14}$	$1.67 \times 10^{-11}$
ELN	13	36.7	59.7	$1.07\times10^{-13}$	$2.32 \times 10^{-11}$
SGK223	14	36.7	59	$1.51\times10^{-13}$	$3.05 \times 10^{-11}$
KIF12	11	36.7	58.8	$1.74\times10^{-13}$	$3.34 \times 10^{-11}$
SELP	11	36.7	58.8	$1.74\times10^{-13}$	$3.34 \times 10^{-11}$
CIRBP	9	36.7	58.7	$1.83\times10^{-13}$	$3.41 \times 10^{-11}$
CTDSP1	9	36.7	58.7	$1.83\times10^{-13}$	$3.41 \times 10^{-11}$

Strongest candidate SL partners for CDH1 by mtSLIPT with observed and expected numbers of CDH1 mutant TCGA breast tumours with low expression of partner genes.

Table C.2: Pathways for *CDH1* partners from mtSLIPT

Pathways Over-represented	Pathway Size	SL Genes	p-value (FDR)
Eukaryotic Translation Elongation	86	60	$2.0 \times 10^{-128}$
Peptide chain elongation	83	59	$2.0 \times 10^{-128}$
Eukaryotic Translation Termination	83	58	$2.3\times10^{-125}$
Viral mRNA Translation	81	57	$2.5\times10^{-124}$
Nonsense Mediated Decay independent of the Exon Junction Complex	88	59	$8.6 \times 10^{-124}$
Nonsense-Mediated Decay	103	61	$5.2 \times 10^{-117}$
Nonsense Mediated Decay enhanced by the Exon Junction Complex	103	61	$5.2 \times 10^{-117}$
Formation of a pool of free 40S subunits	93	58	$1.6 \times 10^{-116}$
L13a-mediated translational silencing of Ceruloplasmin expression	103	59	$1.3 \times 10^{-111}$
3' -UTR-mediated translational regulation	103	59	$1.3 \times 10^{-111}$
GTP hydrolysis and joining of the 60S ribosomal subunit	104	59	$6.2 \times 10^{-111}$
SRP-dependent cotranslational protein targeting to membrane	104	58	$2.9\times10^{-108}$
Eukaryotic Translation Initiation	111	59	$3.0 \times 10^{-106}$
Cap-dependent Translation Initiation	111	59	$3.0 \times 10^{-106}$
Influenza Viral RNA Transcription and Replication	108	57	$5.1 \times 10^{-103}$
Influenza Infection	117	59	$1.5 \times 10^{-102}$
Translation	141	64	$3.7 \times 10^{-101}$
Influenza Life Cycle	112	57	$1.4 \times 10^{-100}$
GPCR downstream signalling	472	116	$1.0\times10^{-80}$
Hemostasis	422	105	$1.4\times10^{-78}$

Gene set over-representation analysis (hypergeometric test) for Reactome pathways in mtSLIPT partners for CDH1.

The genes and pathways identified in Tables C.1 and C.2 were derived from comparing the expression profiles of potential partners to the mutation status of *CDH1* (as shown in Figure 3.2). The following analysis was limited to the samples for which both expression and somatic mutation data were available from TCGA.

### C.2 Synthetic Lethal Expression Profiles

Similar to the analysis of synthetic lethal partners against low *CDH1* expression in 4.1.2, the partners detected from *CDH1* mutation were also examined for their expression profiles and the pathway composition of gene clusters. Hierachical clustering was performed on mtSLIPT partners for *CDH1* as showing in Figure C.1. Overrepresentation for Reactome pathways for each of the gene clusters identified is given in Table C.3.

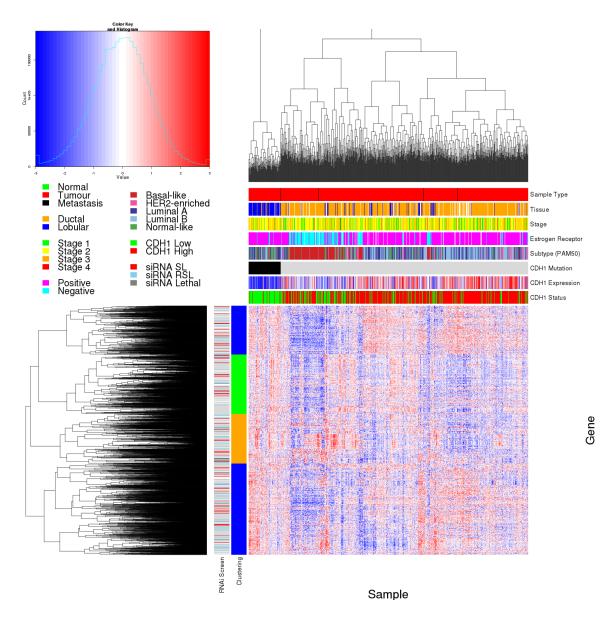

Figure C.1: Synthetic lethal expression profiles of analysed samples. Gene expression profile heatmap (correlation distance) of all samples (separated by CDH1 somatic mutation status) analysed in TCGA breast cancer dataset for gene expression of 3743 candidate partners of E-cadherin (CDH1) from mtSLIPT prediction (with significant FDR adjusted p < 0.05). Deeply clustered, inter-correlated genes form several main groups, each containing genes that were SL candidates or toxic in an siRNA screen Telford  $et\ al.\ (2015)$ . Clusters had different sample groups highly expressing the synthetic lethal candidates in CDH1 mutant samples and often lowly expressing CDH1 wildtype samples (which were not tested for), although many of the CDH1 mutant samples had among the lowest CDH1 expression. In contrast to the expression analysis the (predominantly CDH1 wildtype) basal subtype and ER negative samples have depleted expression among most candidate synthetic lethal partners.

Table C.3: Pathways for clusters of  $\mathit{CDH1}$  partners from mtSLIPT

Pathways Over-represented in Cluster 1	Pathway Size	Cluster Genes	p-value (FDR)
Olfactory Signalling Pathway	57	8	$7.1 \times 10^{-9}$
Assembly of the primary cilium	149	14	$8.0\times10^{-9}$
Sphingolipid metabolism	62	8	$9.6 \times 10^{-9}$
Signalling by ERBB4	133	12	$5.1 \times 10^{-8}$
PI3K Cascade	65	7	$4.9\times10^{-7}$

Pathway over-representation analysis for Reactome pathways with the number of genes in each pathway (Pathway Size), number of genes within the pathway identified (Cluster Genes), and the pathway over-representation p-value (adjusted by FDR) from the hypergeometric test.

#### C.3 Comparison to Primary Screen

The mutation synthetic lethal partners with *CDH1* were also compared to siRNA primary screen data (Telford *et al.*, 2015), as performed in Section 4.2.1. These were expected to be more concordant with the experimental results performed on a null mutant, however this was not the case at the gene level: less genes overlapped with experimental candidates in Figure C.2. This discrepancy was may be due to lower sample size for mutations in TCGA data or lower frequency (expected value) of *CDH1* mutations compared to low expression.

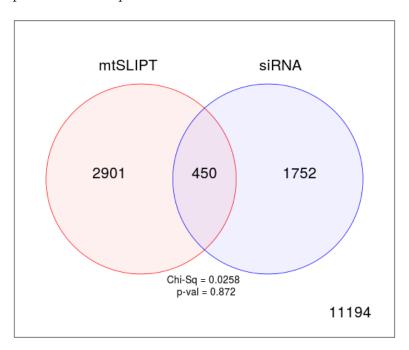

Figure C.2: Comparison of mtSLIPT to siRNA. Testing the overlap of gene candidates for E-cadherin synthetic lethal partners between computational (SLIPT) and experimental screening (siRNA) approaches. The  $\chi^2$  test suggests that the overlap is no more than would be expected by chance (p = 0.281).

Despite a lower sample size (and low number of a predicted partners) for mutation analysis, the pathway composition (Tables C.2 and C.4) was similar to expression analysis, as described in Section 4.2.5. In particular, the resampling analysis (Section C.3.1) supported many of the results of expression analysis (Section 4.2.5.1). Tables C.5 and C.6 detected many of the same or functionally-related pathways.

Table C.4: Pathways for  $\mathit{CDH1}$  partners from mtSLIPT and siRNA

Predicted only by SLIPT (2901 genes)		Genes Identified	- ` '
Eukaryotic Translation Elongation	87	57	$2.8 \times 10^{-120}$
Peptide chain elongation	84	56	$3.1 \times 10^{-120}$
Eukaryotic Translation Termination	84	55	$2.8 \times 10^{-117}$

#### C.4 Compare SLIPT genes

The mutation synthetic lethal partners with *CDH1* were also compared to siRNA primary screen data (Telford *et al.*, 2015), by correlation and siRNA viability as described in sections 4.2.2 and 4.2.3.

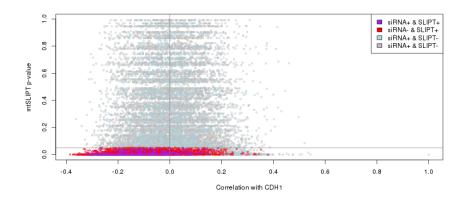

Figure C.3: Compare mtSLIPT and siRNA genes with correlation. The mtSLIPT p-values were compared against Pearson's correlation of expression with *CDH1*. Genes detected by SLIPT or siRNA were coloured according to the legend.

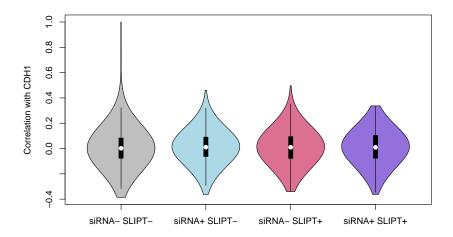

Figure C.4: Compare mtSLIPT and siRNA genes with correlation. Genes detected by mtSLIPT against *CDH1* mutation and siRNA screening were compared against Pearson's correlation of expression with *CDH1*. There were no differences in correlation between the gene groups.

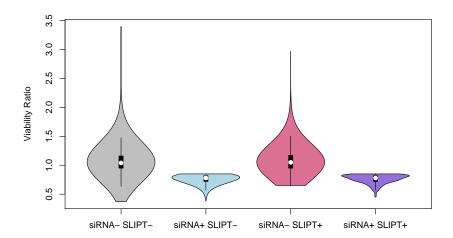

Figure C.5: Compare mtSLIPT and siRNA genes with siRNA viability. Genes detected as candidate synthetic lethal partners by mtSLIPT (in TCGA breast cancer) expression analysis against *CDH1* mutation and experimental screening (with siRNA) were compared against the viability ratio of *CDH1* mutant and wildtype cells in the primary siRNA screen. There were clear no differences in viability between genes detected by mtSLIPT and those not with the differences being primarily due to viability thresholds that were used to detect synthetic lethality by Telford *et al.* (2015).

## C.5 Metagene Analysis

Metagene analysis was performed for synthetic lethal pathways against CDH1 mutation. These were described and compared to expression analysis in Section 4.3.3.

Table C.7: Candidate synthetic lethal metagenes against CDH1 from mtSLIPT

Pathway	ID	Observed	Expected	$\chi^2 {\bf value}$	p-value	p-value (FDR)
Neurotoxicity of clostridium toxins	168799	8	36.7	79.4	$5.71 \times 10^{-18}$	$3.14 \times 10^{-15}$
Aquaporin-mediated transport	445717	8	36.7	76.3	$2.73\times10^{-17}$	$9.01 \times 10^{-15}$
Toxicity of botulinum toxin type G (BoNT/G)	5250989	8	36.7	76.3	$2.73\times10^{-17}$	$9.01 \times 10^{-15}$

RA biosynthesis pathway	5365859	13	36.7	44.6	$2.03\times10^{-10}$	$2.58\times10^{-9}$

Strongest candidate SL partners for CDH1 by mtSLIPT with observed and expected numbers of mutant CDH1 TCGA breast cancer tumours with low expression of partner metagenes.

### C.6 Expression of Somatic Mutations

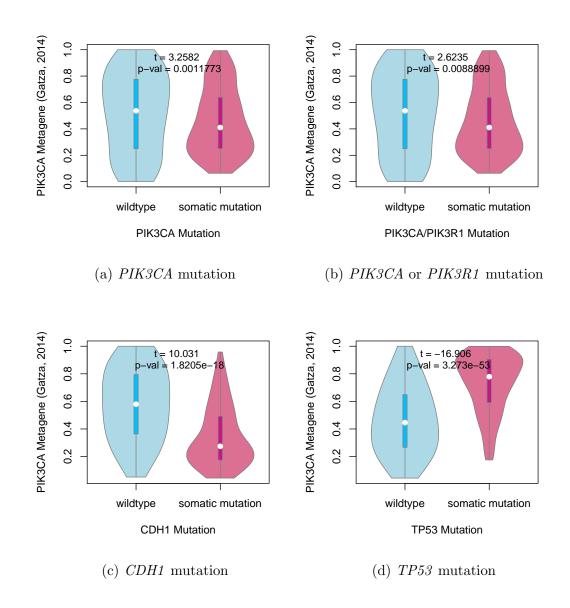

Figure C.6: **Somatic mutation against PIK3CA metagene.** Mutations in *PIK3CA*, *PIK3R1*, *CDH1*, and *TP53* were examined in TCGA breast cancer for their effect on the PIK3CA (Gatza *et al.*, 2014) pathway metagene. The tumour suppressors *CDH1* and *TP53* showed an increase and decrease in the metagene respectively, whereas *PIK3CA* and *PIK3R1* mutations weaker evidence of decrease in metagene levels.

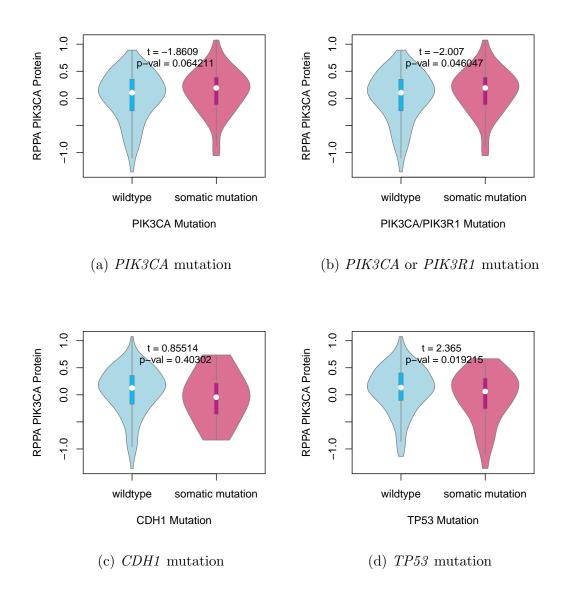

Figure C.7: **Somatic mutation against PI3K protein.** Mutations in PIK3CA, PIK3R1, CDH1, and TP53 were examined in TCGA breast cancer for their effect on the expression of the p110 $\alpha$  protein (encoded by PIK3CA). Protein levels were significantly elevated in samples with PIK3CA or PIK3R1 mutations and lower in samples with TP53 mutations.

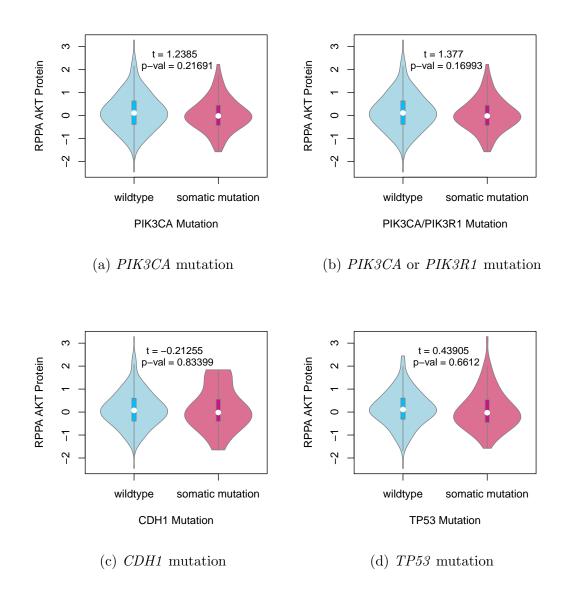

Figure C.8: **Somatic mutation against AKT protein.** Mutations in *PIK3CA*, *PIK3R1*, *CDH1*, and *TP53* were examined in TCGA breast cancer for their effect on the expression of the AKT protein (a downstream target of *PIK3CA*). Protein levels were not significantly different in samples mutations in any of these cancer genes.

### C.7 Metagene Expression Profiles

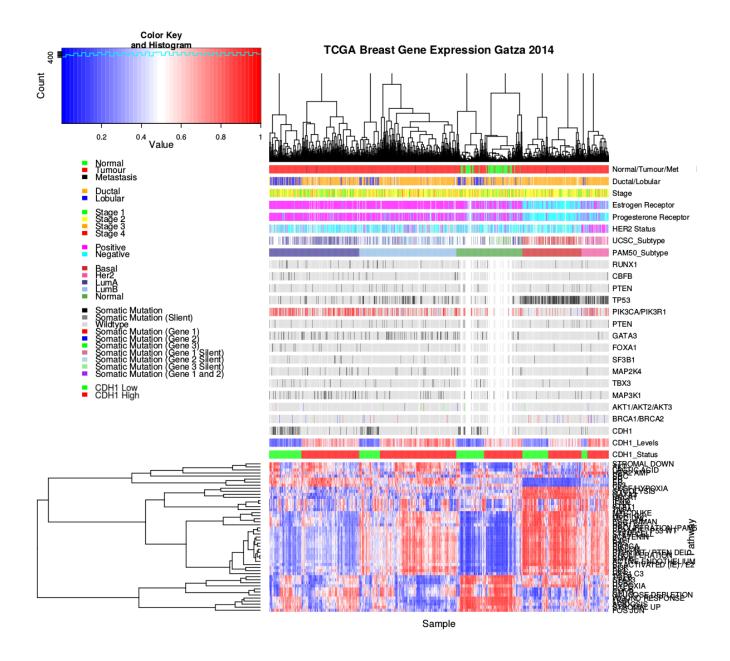

Figure C.9: **Pathway metagene expression profiles.** Expression profiles for metagene signatures from Gatza *et al.* (2014) in TCGA breast data, annotated for clinical factors and cancer gene mutations.

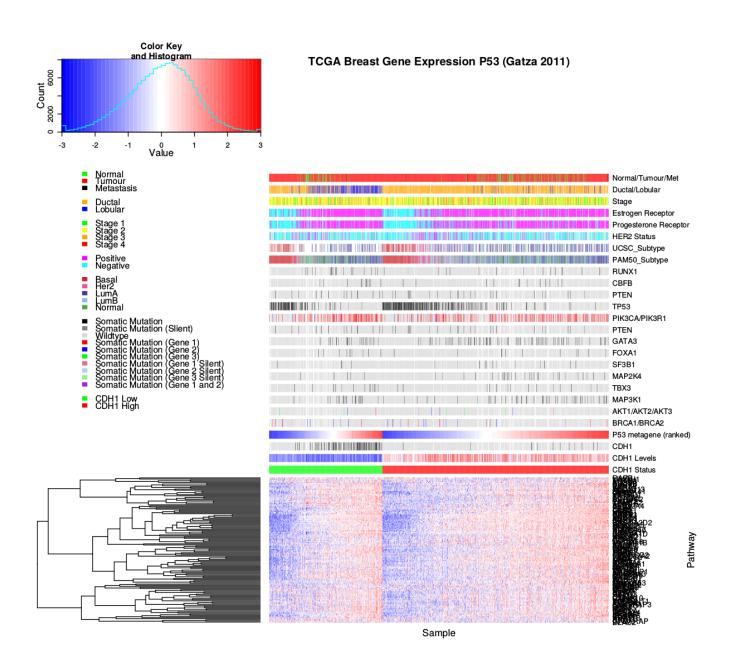

Figure C.10: Expression profiles for p53 related genes. Expression profiles the genes contained in the TP53 gene signature from Gatza et al. (2011) in TCGA breast data, annotated for clinical factors and cancer gene mutations. Samples were separated by CDH1 expression status and sorted by the metagene. In both cases, the majority of genes were consistent with the direction of the metagene, with few very exceptions. TP53 mutant samples had low metagene expression, consistent with loss of tumour suppressor functions, and were less likely to have CDH1 or PIK3CA mutations.

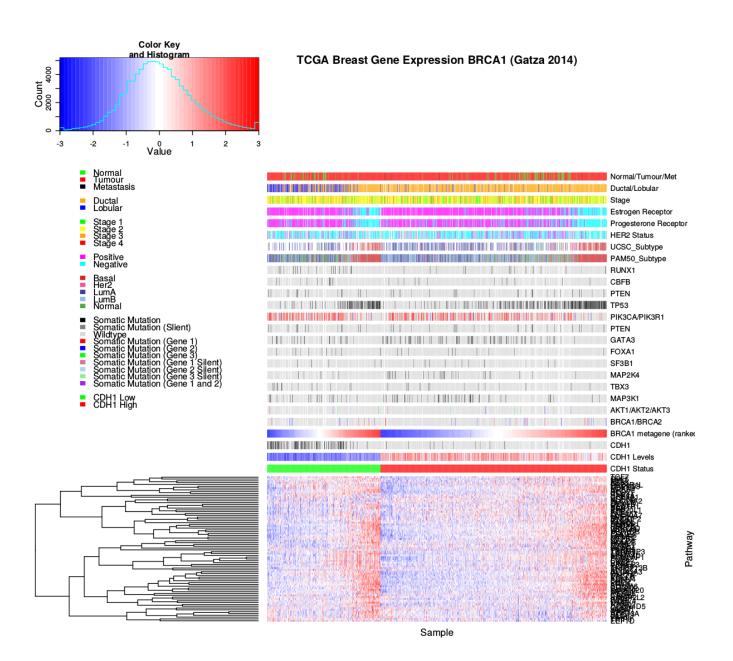

Figure C.11: Expression profiles for BRCA related genes. Expression profiles the genes contained in the gene signature related to BRCA1 and BRCA2 functions from Gatza et al. (2014) in TCGA breast data, annotated for clinical factors and cancer gene mutations. Samples were separated by CDH1 expression status and sorted by the metagene. In both cases, the majority of genes were consistent with the direction of the metagene, with few very exceptions. BRCA1 and BRCA2 mutant samples had higher metagene expression than most samples for the ductal subtype, although this was not the case (for the lobular samples for which the metagene was lower). However, the metagene was higher for basal subtype and ER negative samples.

## Appendix D

## Intrinsic Subtyping

The intrinsic subtypes for TCGA breast cancer samples provided by University of California, Santa Cruz (UCSC) (TCGA, 2012; UCSC, 2012) that were derived from microarray analysis have been compared to the Prediction Analysis of Microarray 50 (PAM50) results for performing subtyping from RNA-Seq data (Parker *et al.*, 2009). As shown in Table D.1, these subtypes were highly concordant for samples which had both procedures performed upon them ( $\chi^2 = 1305.9$ ,  $p = 2.73 \times 10^{-268}$ ). The main exception were the luminal A samples some of which were reclassified as luminal B or "normal-like".

Table D.1: Comparison of intrinsic subtypes

UCSC Subtype						
Basal-like	HER2-enriched	Luminal A	Luminal B	Normal-like		
100	58	232	128	30		
PAM50 Subtype						
Basal-like	HER2-enriched	Luminal A	Luminal B	Normal-like		
208	94	314	334	227		

	UCSC Subtype					
PAM50 Subtype	Basal-like	HER2-enriched	Luminal A	Luminal B	Normal-like	
Basal-like	96	4	2	2	1	
HER2-enriched	0	47	5	3	0	
Luminal A	1	0	141	1	0	
Luminal B	2	7	49	121	0	
Normal-like	1	0	35	1	29	

The intrinsic subtypes of TCGA breast samples were compared between those provided by UCSC (TCGA, 2012) from microarray expression to those derived from RNA-Seq data (Parker *et al.*, 2009). Comparisons between these were limited to samples for which both data types were available.

The PAM50 subtypes could be more accurate given similarity of these subtypes and that the remainder of the subtypes were accurately recapitulated with RNA-Seq data. Furthermore, UCSC subtypes correctly identified <sup>22</sup>/<sub>22</sub> normal samples as "normal-like" and PAM50 subtyping in RNA-Seq data had a success rate of <sup>112</sup>/<sub>113</sub> (including all of those identified from microarrays). Therefore the PAM50 subtypes (performed on a larger cohort of samples) are appropriate to use for further interpretation, superseding the UCSC subtypes available for a limited set of samples.

# Appendix E

# Stomach Expression Analysis

The following results are a replication of the TCGA results (in Chapter 4) with stomach cancer data, using synthetic lethality (SLIPT) against *CDH1*.

### E.1 Synthetic Lethal Genes and Pathways

Table E.1: Synthetic lethal gene partners of CDH1 from SLIPT in stomach cancer

Gene	Observed	Expected	$\chi^2$ value	p-value	p-value (FDR)
PRAF2	17	50.4	121	$3.54\times10^{-25}$	$1.45 \times 10^{-21}$

Cap-dependent Translation Initiation	112	52	$2.0 \times 10^{-90}$

Gene set over-representation analysis (hypergeometric test) for Reactome pathways in SLIPT partners for CDH1.

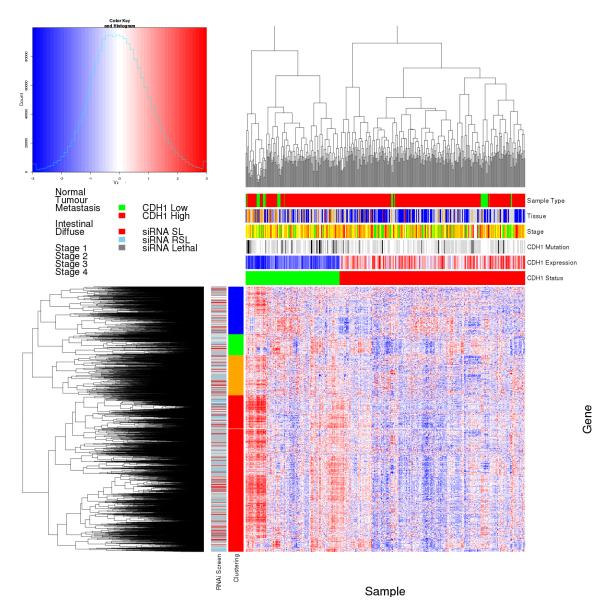

Figure E.1: Synthetic lethal expression profiles of analysed samples. Gene expression profile heatmap (correlation distance) of all samples (separated by the  $^{1}$ /3 quantile of CDH1 expression) analysed in TCGA stomach cancer dataset for gene expression of 4365 candidate partners of E-cadherin (CDH1) from SLIPT prediction (with significant FDR adjusted p < 0.05). Deeply clustered, inter-correlated genes form several main groups, each containing genes that were SL candidates or toxic in an siRNA screen Telford  $et\ al.\ (2015)$ . Clusters had different sample groups highly expressing the synthetic lethal candidates in CDH1 low samples. Notably, diffuse and CDH1 mutant samples had elevated expression in one or more distinct clusters, although there was less complexity and variation among candidate synthetic lethal partners than in breast data. CDH1 low samples also contained most of samples with CDH1 mutations.

Table E.3: Pathways for clusters of  $\mathit{CDH1}$  partners in stomach SLIPT

Pathways Over-represented in Cluster 1		Cluster Genes	- \
Viral mRNA Translation	82	48	$1.3 \times 10^{-97}$
Formation of a pool of free 40S subunits	94	51	$1.3 \times 10^{-97}$
Eukaryotic Translation Elongation	87	49	$4.8 \times 10^{-97}$
Peptide chain elongation	84	48	$1.4 \times 10^{-96}$
Eukaryotic Translation Termination	84	48	$1.4 \times 10^{-96}$
GTP hydrolysis and joining of the 60S ribosomal subunit	105	52	$7.9 \times 10^{-94}$

Pathway over-representation analysis for Reactome pathways with the number of genes in each pathway (Pathway Size), number of genes within the pathway identified (Cluster Genes), and the pathway over-representation p-value (adjusted by FDR) from the hypergeometric test.

#### E.2 Comparison to Primary Screen

The synthetic lethal partners with *CDH1* expression in stomach cancers were also compared to siRNA primary screen data (Telford *et al.*, 2015), as performed in Section 4.2.1. These were expected to be more concordant with the experimental results performed on a null mutant, however this was not the case at the gene level: less genes overlapped with experimental candidates in Figure E.2. This may be due to lower sample size for mutations in TCGA data or lower frequency (expected value) of *CDH1* mutations compared to low expression.

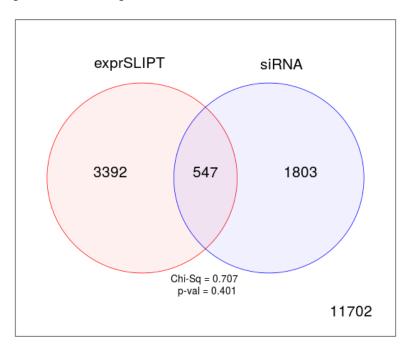

Figure E.2: Comparison of SLIPT in stomach to siRNA. The overlap of gene candidates for E-cadherin synthetic lethal partners between computational (SLIPT) and experimental screening (siRNA) approaches. The  $\chi^2$  test suggests that the overlap is no more than would be expected by chance (p = 0.281).

Table E.4: Pathways for  $\mathit{CDH1}$  partners from SLIPT and siRNA

Predicted only by SLIPT (3392 genes)	Pathway Size	Genes Identified	p-value (FDR)

Ion transport by P-type ATPases	936837	17	50.4	100	$8.29 \times 10^{-21}$	$8.06 \times 10^{-19}$
Sialic acid metabolism	4085001	19	50.4	95.3	$9.95\times10^{-20}$	$7.82\times10^{-18}$
Synthesis of pyrophosphates in the cytosol	1855167	26	50.4	94	$1.86\times10^{-19}$	$1.23\times10^{-17}$
Keratan sulfate/keratin metabolism	1638074	25	50.4	93.5	$2.36 \times 10^{-19}$	$1.44 \times 10^{-17}$
Ion channel transport	983712	19	50.4	92.8	$3.37\times10^{-19}$	$1.99\times10^{-17}$
Keratan sulfate biosynthesis	2022854	26	50.4	91.4	$6.79\times10^{-19}$	$3.62\times10^{-17}$
Arachidonic acid metabolism	2142753	22	50.4	90.6	$9.81\times10^{-19}$	$5.07 \times 10^{-17}$
RHO GTPases activate CIT	5625900	22	50.4	87	$5.80\times10^{-18}$	$2.66\times10^{-16}$
Stimuli-sensing channels	2672351	25	50.4	85.8	$1.03\times10^{-17}$	$4.58\times10^{-16}$
Synthesis of PI	1483226	19	50.4	85.6	$1.15\times10^{-17}$	$4.89\times10^{-16}$
G-protein activation	202040	19	50.4	85.3	$1.34\times10^{-17}$	$5.53\times10^{-16}$
NrCAM interactions	447038	22	50.4	84.3	$2.1\times10^{-17}$	$8.27\times10^{-16}$
Inwardly rectifying $K^+$ channels	1296065	24	50.4	83.5	$3.19\times10^{-17}$	$1.22\times10^{-15}$
Calcitonin-like ligand receptors	419812	20	50.4	82.2	$6.07 \times 10^{-17}$	$2.13 \times 10^{-15}$
Prostacyclin signalling through prostacyclin receptor	392851	24	50.4	81.8	$7.27\times10^{-17}$	$2.5\times10^{-15}$
Presynaptic function of Kainate receptors	500657	26	50.4	79.7	$2.00\times10^{-16}$	$6.34\times10^{-15}$
ADP signalling through P2Y purinoceptor 12	392170	23	50.4	79.2	$2.57 \times 10^{-16}$	$7.71 \times 10^{-15}$
regulation of FZD by ubiquitination	4641263	22	50.4	78.8	$3.15\times10^{-16}$	$9.3\times10^{-15}$
Toxicity of tetanus toxin (TeNT)	5250982	27	50.4	78.7	$3.36\times10^{-16}$	$9.75\times10^{-15}$
Gap junction degradation	190873	21	50.4	78.5	$3.66\times10^{-16}$	$1.04\times10^{-14}$
Nephrin interactions	373753	25	50.4	78.2	$4.21\times10^{-16}$	$1.14\times10^{-14}$
GABA synthesis, release, reuptake and degradation	888590	26	50.4	77	$7.69 \times 10^{-16}$	$1.95 \times 10^{-14}$

Strongest candidate SL partners for CDH1 by SLIPT with observed and expected numbers of TCGA stomach cancer samples with low expression of both genes.
